To optimize the processing of natural gas, accurate thermodynamic data are required. Here, we investigate the quality of the physically based BACKONE equation of state, which requires only 3-5 substance specific parameters for each pure component. For mixtures, only one mixture parameter for each binary and no ternary parameters are required.

However, highly accurate data for thermodynamic properties at liquid states of the relevant systems are rare. While most properties can be determined at liquid states with higher accuracy than at gaseous or supercritical states for pure fluids, it is difficult to determine the exact composition of the liquid in the measuring cell for the mixtures considered here.
