8.1: Basics of Differential Equations alculus is the mathematics of change, and rates of change are expressed by derivatives. Thus, one of the most common ways to use calculus is to set up an equation containing an unknown function $y=f(x)$ and its derivative, known as a differential equation.

Differential equations are the language of the models we use to describe the world around us. In this mathematics course, we will explore temperature, spring systems, circuits, population growth, and biological cell motion to illustrate how differential equations can be used to model nearly everything in the world around us.

A basic understanding of calculus is required to undertake a study of differential equations. This zero chapter presents a short review. 0.1The trigonometric functions The Pythagorean trigonometric identity is $\sin^2x + \cos^2x = 1$, and the addition theorems are $\sin(x + y) = \sin(x)\cos(y) + \cos(x)\sin(y)$, $\cos(x + y) = \cos(x)\cos(y) - \sin(x)\sin(y)$.

Bernoulli Differential Equations – In this section we solve Bernoulli differential equations, i.e. differential equations in the form $y' + p(x)y = q(x)y^n$? + p (x) y = q (x) y^n. This section will also introduce the idea of using a substitution to help us solve differential equations.

Differentials, like dx, dy, represent a infinitesimal change in the variable, and are first introduced as part of basic calculus (or even precalculus, but without explaining what they are). Differential equations are much more advanced, and should be studied once you have a firm knowledge of both differential calculus and integral calculus.

Introduction to Partial Differential Equations ...

An ordinary differential equation (ODE) is an equation that involves some ordinary derivatives (as opposed to partial derivatives) of a function. Often, our goal is to solve an ODE, i.e., determine what function or functions satisfy the equation. If you know what the derivative of a function is, how can you find the function itself?

Introduction to Differential Equations Suppose we have an equation like and want to find a solution. Equations with derivatives are called differential equations and solving them means finding a function that satisfies the equation. In this case, $y = f(x) = x^2 + C$ provides the family of solutions.
