This volume contains the proceedings of the XIX International Colloquium on Mechanical Fatigue of Metals, held at the Faculty of Engineering of the University of Porto, Portugal, 5-7 September 2018. This International Colloquium facilitated and encouraged the exchange of knowledge and experiences among the different communities involved in both basic and applied research in the field of the fatigue of metals, looking at the problem of fatigue exploring analytical and numerical simulative approaches. Fatigue damage represents one of the most important types of damage to which structural materials are subjected in normal industrial services that can finally result in a

sudden and unexpected abrupt fracture. Since metal alloys are still today the most used materials in designing the majority of components and structures able to carry the highest service loads, the study of the different aspects of metals fatigue attracts permanent attention of scientists, engineers and designers.

The purpose of this book will be to demonstrate 1) the newly developed method of using reactive functionalized materials in agriculture to solve the economic and public health problems associated with using conventional agrochemicals; and 2) new technology aimed at achieving the greening of chemistry to meet appropriate environmental

standards in both agriculture and industrial foodstuffs production. More specifically, the book will accomplish this goal by addressing 3 key issues in the field: 1) the production of reactive functionalized materials with enhanced properties that offer a major opportunity to overcome the disadvantages of using traditional materials; 2) the applications of functionalized materials in agriculture for the purpose of solving the economic and the environmental pollution problems associated with the uses of conventional agrochemicals; and 3) the contribution of polymers in solving problems associated with conventional procedures of food growth and processing, including those used in the dairy industry,

This handbook serves as a guide to deploying battery energy storage technologies, specifically for distributed energy resources and flexibility resources. Battery energy storage technology is the most promising, rapidly developed technology as it provides higher efficiency and ease of control. With energy transition through decarbonization and decentralization, energy storage plays a significant role to enhance grid efficiency by alleviating volatility from demand and supply.

Energy storage also contributes to the grid integration of renewable energy and promotion of microgrid.

"Japan's official efforts at internationalization have been painful to witness. . . . The government's JET program is easily the most ambitious and its history and on-the-ground problems offer significant insights into Japan's struggle to open up to the outside. David McConnell's book provides a most interesting analysis of why this process has been so complex and difficult. It tells us much about Japanese society and education at this critical point in time."—Thomas P.

Rohlen, author of *For Harmony and Strength* "In this superb and insightful book, David McConnell explores perhaps the greatest (certainly the biggest) education program in humankind's history, offering patient, balanced analysis of its workings, problems, and accomplishments. McConnell's confucian equanimity and multifaceted perspectives lend the book a depth seldom found in contemporary writing on Japan."—Robert Juppe, First ALT Advisor for the JET Program "This is a very astute, thorough, and personal account of the JET program as a case study of how a program can both change a system and provoke defenses against any change. With his fine ethnographic and analytic material, McConnell
