When the contact is closed, ladder rail power flows across the contact and the result of logic operation (RLO) = "1". Otherwise, if the signal state at the specified <address>is "0", the contact is open. When the contact is open, power does not flow across the contact and the result of logic operation (RLO) = "0".

The first type of timer in ladder logic is the on delay timer. Its name comes from the fact, that the on delay timer delays its output from the on signal. As soon as the on delay timer gets a signal at the input, the timer starts to count down. When the preset time is up, the output of the on delay timer will turn on.
