The ethical implications of human clones have been much alluded to, but have seldom been examined with any rigour. This paper examines the possible uses and abuses of human cloning and draws out the principal ethical dimensions, both of what might be done and its meaning. The paper examines some of the major public and official responses to cloning by authorities such as President Clinton, the ...

The regulation of human cloning continues to be a significant national and international policy issue. Despite years of intense academic and public debate, there is little clarity as to the philosophical foundations for many of the emerging policy choices. The notion of "human dignity" is commonly used to justify cloning laws. The basis for this justification is that reproductive human cloning ...

We define human cloning as the attempt to produce a human organism by any cloning procedure: blastomere isolation, bisection (splitting) of preimplantation embryos, and nuclear transplantation. Nuclear transplantation of embryonic, fetal, or adult cells from all species results in abnormal animals at a frequency that increases with the age of the donor cell.

The international stance on cloning is clearer, with the United Nations General Assembly banning all forms of human cloning in 2005, including both reproductive and therapeutic. For these legal reasons as well as ethical reasons, it's probable that the future of cloning will lie more in therapeutic cloning research than reproductive cloning. The only difference between therapeutic cloning and reproductive cloning is that in therapeutic cloning the embryo is never transferred into a female ...

Human Cloning. Human cloning is the making of a genetically identical copy of a human. It doesn't allude to monozygotic multiple births or the reproduction of humans/animals cells or tissue. The morals of cloning are an amazingly controversial issue. The term is for the most part used to allude to artificial human cloning; human clones as indistinguishable twins are common place, with their cloning occurring throughout the natural process of reproduction.

The cloning of humans remains universally condemned, primarily for the associated psychological, social, and physiological risks. There are also concerns that cloning promotes eugenics, the idea that humanity could be improved through the selection of individuals possessing desired traits. There also exists controversy over the ethics of therapeutic and research cloning, which makes use of embryos that are otherwise discarded.
