Signals exist naturally and are also created by people. Some operate continuously (known as continuous-  
time signals); others are active at specific instants of time (and are called discrete-time signals).

Continuous-time signal is the “function of continuous-time variable that has uncountable or infinite set of numbers in its sequence”. The continuous-time signal can be represented and defined at any instant of the time in its sequence. The continuous-time signal is also termed as analog signal.

~~Definition of Continuous And Discrete Signals | Chegg.com~~

Continuous systems are those types of systems in which input and output signals are the same at both the ends. In this type of system, variable changes with time and any type of variation is not found in the input and output signal. In response to the input signal, a continuous system generates an output signal.
