In recent years, certain forms of the Boltzmann equation--now going by the name of "Lattice Boltzmann equation" (LBE)--have emerged which relinquish most mathematical complexities of the true Boltzmann equation without sacrificing physical fidelity in the description of complex fluid motion.

Speeds in lattice Boltzmann simulations are typically given in terms of the speed of sound. The discrete time unit can therefore be given as. $\tau = \frac{\Delta t}{c_s}$, where the denominator, c_s is the physical speed of sound.

The Boltzmann equation or Boltzmann transport equation (BTE) describes the statistical behaviour of a thermodynamic system not in a state of equilibrium, devised by Ludwig Boltzmann in 1872. The classic example of such a system is a fluid with temperature gradients in space causing heat to flow from hotter regions to colder ones, by the random but biased transport of the particles making up ...

The Lattice Boltzmann method is relatively new. The Method of lattice Boltzmann equation (LBE) is an innovative numerical method based on kinetic theory to simulate various hydrodynamic systems. The lattice Boltzmann equation was introduced to overcome some serious deficiencies of its historic predecessor: the lattice gas automata.

Abstract. A simple lattice Boltzmann equation (LBE) model for axisymmetric thermal flow is proposed in this paper. The flow field is solved by a quasi-two-dimensional nine-speed (D2Q9) LBE, while the temperature field is solved by another four-speed (D2Q4) LBE. The model is validated by a thermal flow in a pipe and some nontrivial thermal buoyancy-driven flows in vertical cylinders, including Rayleigh–Bénard convection, natural convection, and heat transfer of swirling flows.

This work combines the lattice Boltzmann equation (LBE) and the overset method to simulate moving boundary problems in Navier-Stokes flows in two dimensions (2D). The transformation of the velocity moments of the distribution functions between a moving frame of reference and the one at rest is analyzed.

This paper proposes an optimal two-relaxation-time (OTRT) lattice Boltzmann equation (LBE) for solid-liquid phase change. By using the Chapman-Enskog expansion, the OTRT LBE can recover the enthalpy-based energy governing equation up to second-order accuracy.

We define the lattice Boltzmann equation in three dimensions as: $(1) f_{ijk}(x + ic\tau)(y + jc\tau)(z + kc\tau)(t + \tau) = f_{ijk}(x, y, z, t) + \tau \left(\frac{\partial f_{ijk}}{\partial t} + v_i \frac{\partial f_{ijk}}{\partial x} + v_j \frac{\partial f_{ijk}}{\partial y} + v_k \frac{\partial f_{ijk}}{\partial z} \right)$. Here i, j, k refer to the variables in momentum space with c being the velocity quantum and $i, j, k \in \{x, y, z\}$ are the variables in space and t is the time variable.

It is shown that the lattice Boltzmann equation is a special discretized form of the Boltzmann equation. Various approximations for the discretization of the Boltzmann equation in both time and phase space are discussed in detail. A general procedure to derive the lattice Boltzmann model from the continuous Boltzmann equation is demonstrated explicitly.

The lattice Boltzmann equation (LBE) is directly derived from the Boltzmann equation by discretization in both time and phase space. A procedure to systematically derive discrete velocity models is presented. A LBE algorithm with arbitrary mesh grids is proposed and a numerical simulation of the backward-facing step is conducted.

Lattice Boltzmann Method Implementation To implement the LBM method, we separate the solution of the equation $f_i(x + ei\tau, t + \tau) = f_i(x, t) + \tau i(t)$. into two steps, referred to as streaming and collision steps. This approach is somewhat analogous to the common splitting mechanism used in solutions to the Navier-Stokes equations.
